

## 5. Labour market flows

(supplementary questionnaire of the Labour Force Survey, Q1, 2016)

A supplementary survey called 'Labour Market Flows' was linked again to the Labour Force Survey, Q1 2016 which was carried out on the selected sample of households of the basic survey at the same time.

The aim of the survey was the complex examination of the 15–74 years old people in the following three themes:

Labour market flow characteristic of those exiting or entering their employment status and within those who change their workplace

mobility and migration intent

agricultural work, including production for own consumption.

Concepts related to the survey:

**Entrants** are those who created an employment relationship at an employer, or membership relationship with the obligation to work, or outside worker relationship or entered into self-employment; i.e. those who created a labour relation in the reference year (From 1 January to 31 December).

10.6% of the entrants the **changers** are those, who had left their previous job voluntarily or by force in the reference year but then they started working again. People who exits are those, who cancel their employment relationship at an employer, or their membership relationship with the obligation to work, or their outside worker relationship or terminated their self-employment activity, i.e. from employment status they entered to unemployed or inactive status.

10.6% of the respondents aged 15–74 who answered the basic survey did not answer the supplementary survey Q1 2016.

**The non-performance rates (rates of those who answered the basic survey but did not answer the supplementary survey) of the supplementary survey "Labour Market Flows", Q1 2016 (weighted data)**

There may be some differences between the same aggregates of the published absolute numbers due to weighting and summing up. The evaluation of the distribution ratios was made electronically – without individual correction, so the sum of partial data is not always equal to the displayed rounded value of the aggregated data.
